```java
package com.aop;

import org.springframework.context.ApplicationContext;
import org.springframework.context.support.ClassPathXmlApplicationContext;

public class Demo {
    public void demo01(){
        int a=1/0;
        System.out.println("demo1");
    }

    public void demo02(){
        System.out.println("demo2");
    }

    public void demo03(){
        System.out.println("demo3");
    }

    public void demo04(String temp){
        System.out.println("demo4");
    }

    public String demo05(String temp,int temp2){
        System.out.println("demo5");
        return "demo5的返回值";
    }

    public static void main(String[] args) {
        ApplicationContext ac=new
ClassPathXmlApplicationContext("com/aop/applicationContext.xml");
        Demo demo=ac.getBean("demo",Demo.class);
        demo.demo01();
        demo.demo02();
        demo.demo03();
        demo.demo04("传递的参数");
        demo.demo05("传递的参数",123456789);
    }

}
```
